Device Efficiency

User Guide

Operational reference for frequency monitoring, menu navigation, and DNS setup

Application	**Device Efficiency (WEB APP)**
Version	v1.0
Document date	April 2026
Contents	Main screen, menu actions, application settings, about, license, and DNS setup

This guide explains the primary user interactions in Device Efficiency, including live CPU frequency monitoring, fixed-frequency control, supporting information screens, and DNS configuration.

1. Main Screen Overview

1.1 Dashboard view

The main page displays real-time information about registered devices. It gives operators a quick overview of the fleet through summary cards, live charts, and the main device list. From here, users can immediately see how many devices are registered, how many are online, and how activity is distributed between groups.

The device table on the dashboard is the main entry point for day-to-day work. It shows the current state of each device, the assigned group, the latest activity, and the available actions. Admin users can also send commands from this page, while regular Users can review the same information without changing device behavior.

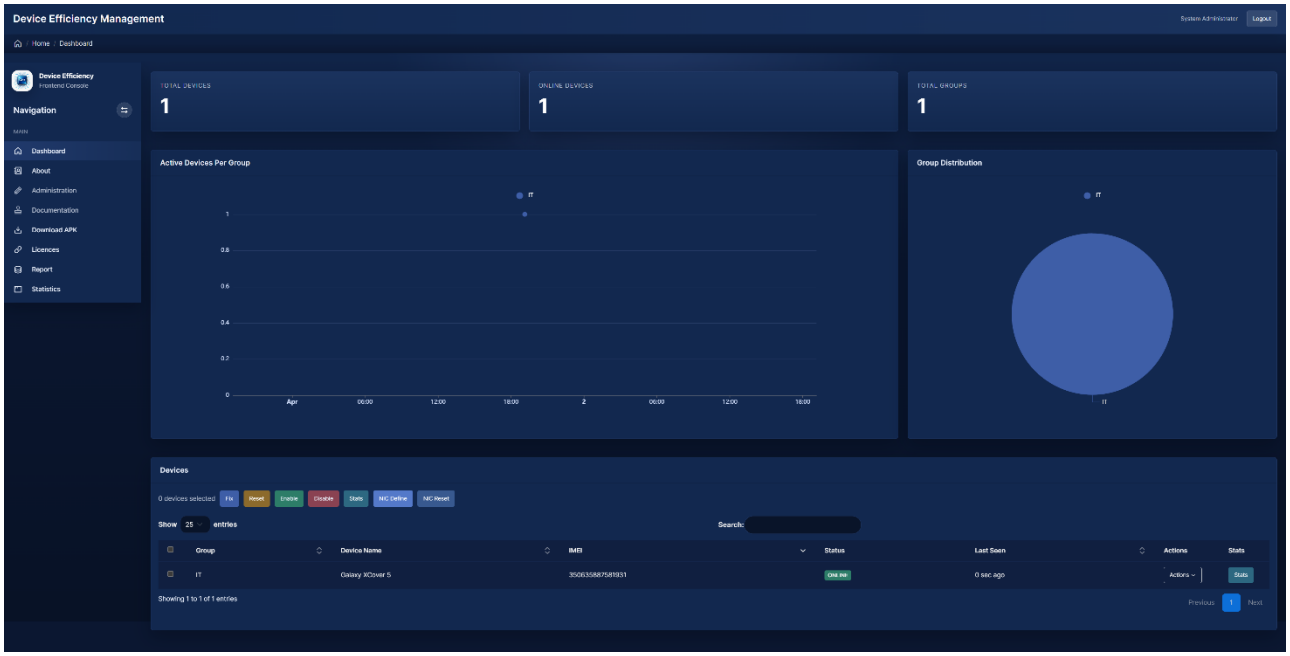

Figure 1. Dashboard overview.

1.2 Device statistics view

Selecting a device opens a detailed monitoring view. This page is intended for deeper investigation and provides CPU frequency timelines, fixed session summaries, application statistics, crash history, and command history for the selected device.

Even when a device is currently offline, the page can still present the latest stored information. This makes it possible to review the recent state of a device after a disconnect and helps operators understand what happened before the device went offline.

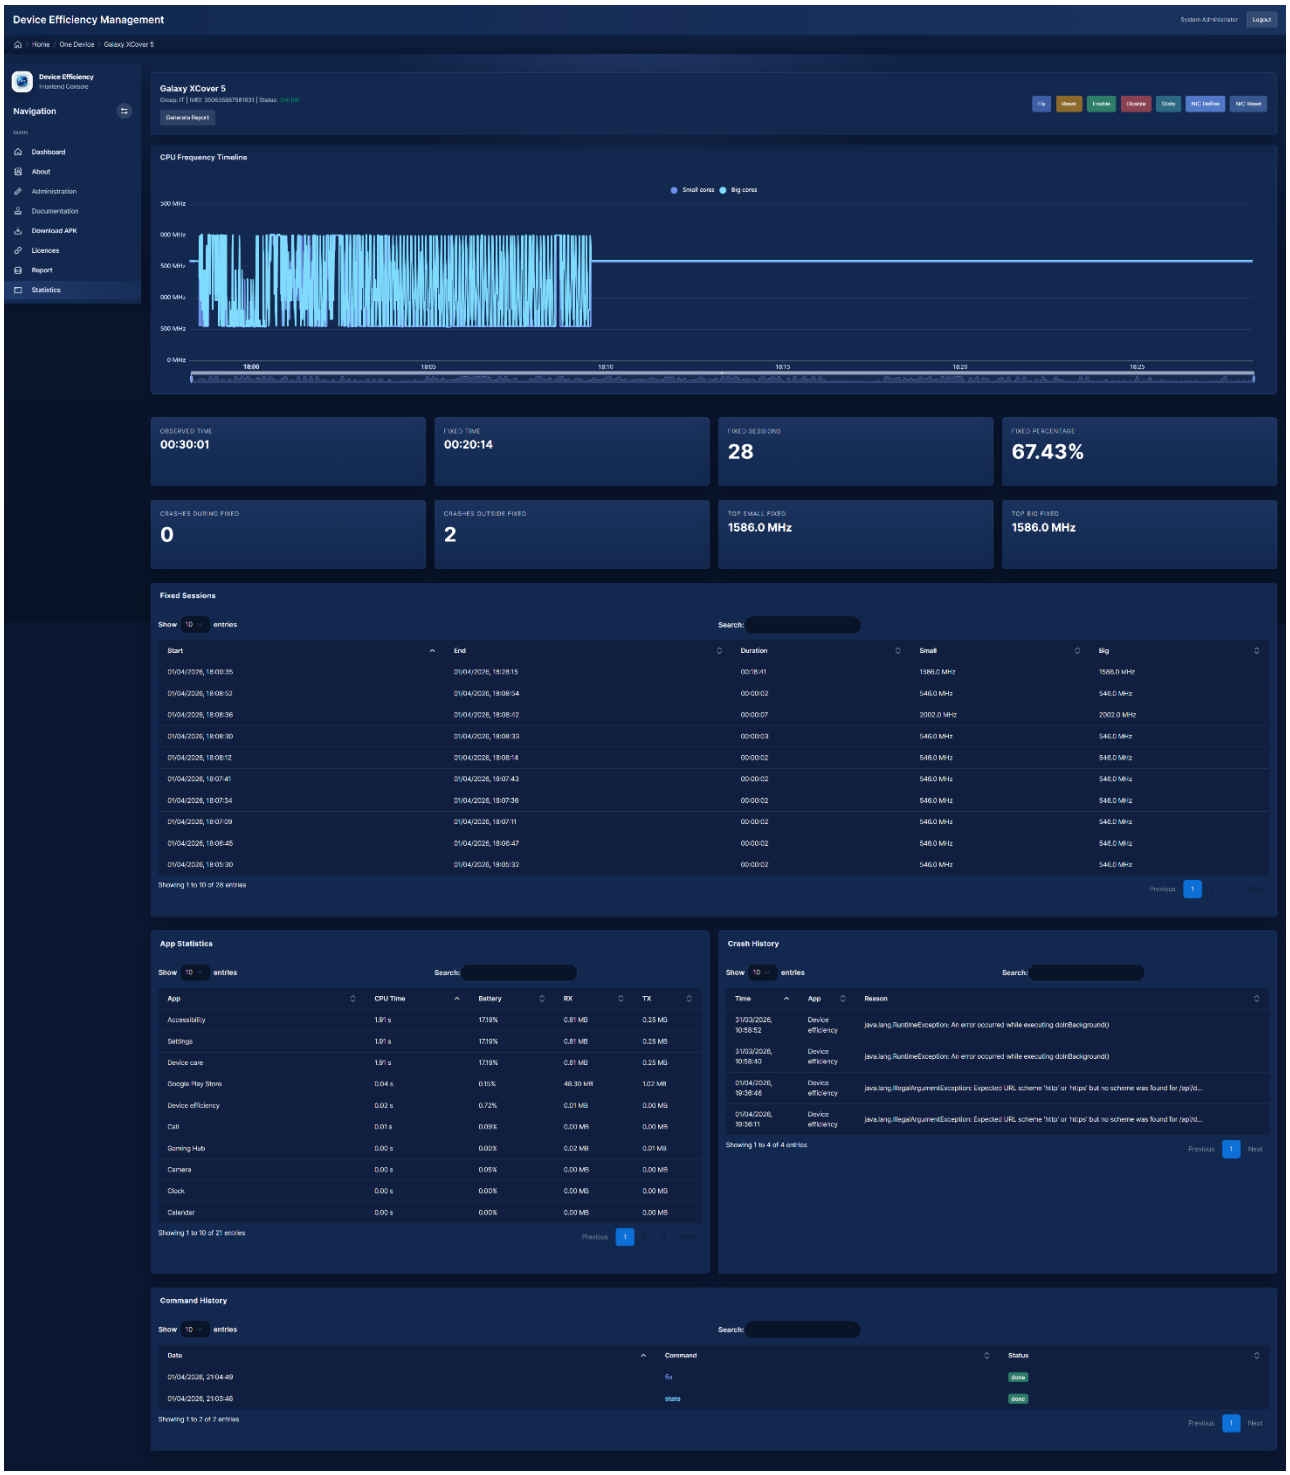

Figure 2. Device monitoring page.

2. Menu and Control Actions

2.1 Device control actions

The application provides control actions that are available from the dashboard and from the single-device page. These actions are intended for operational control of Android devices and are available only to Admin users. Regular Users can review all results and histories, but they cannot issue commands.

Control	Description
Fix	Applies the fixed CPU frequency configuration to the selected device or devices.
Reset	Restores default device behavior and clears the current fixed setup.
Enable	Starts or enables the monitoring and fixer workflow on the device.
Disable	Stops or disables the monitoring and fixer workflow.
Stats	Requests a fresh statistics payload from the device so the operator can review the most recent snapshot.
NIC Define	Fixes the mac address of the target device
NIC Reset	Un-fixes the mac address of the target device

Figure 3. Command buttons.

Every command is stored in the backend together with its status. Generated reports can also show who triggered the command, which makes command review easier during troubleshooting or later audit.

The main dashboard enables administrators to select multiple devices and perform batch command execution.

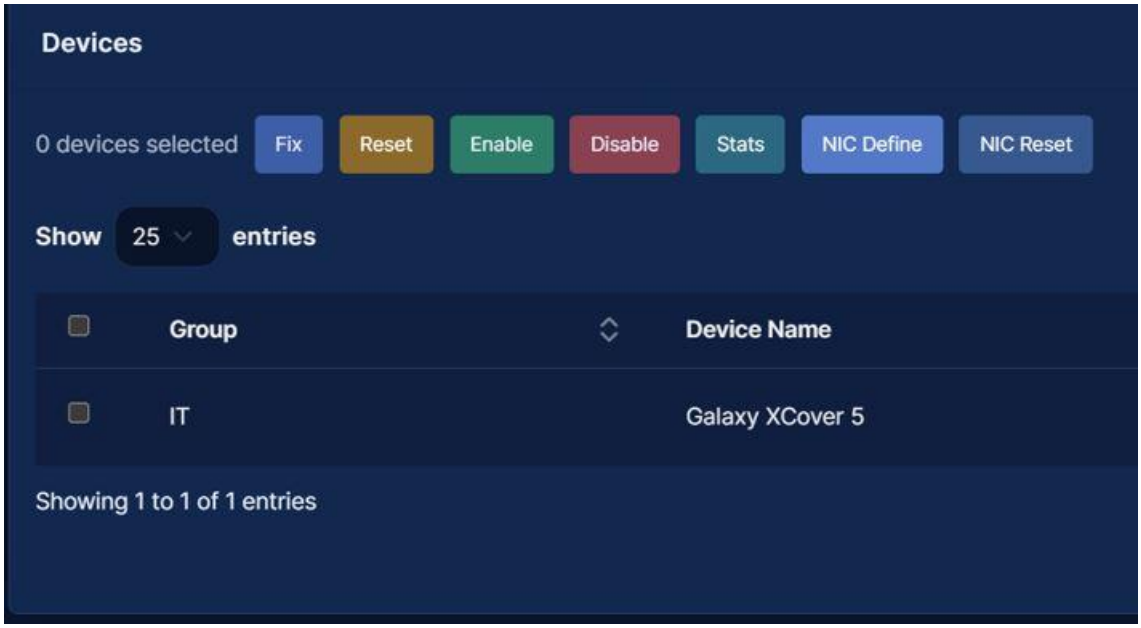

Figure 4. Command buttons on front page.

2.2 User roles

The web application supports two access levels.

Role	Access
Admin	Can monitor devices, open all pages, export reports, review licences, and **send commands** to devices.
User	Can monitor devices, open all pages, export reports, and review licences, but **cannot send commands**.

3. Reports

3.1 Report generation

The Reports page allows generating PDF reports for selected devices. Reports combine device summary information with frequency sessions, crash history, and command history in a printable format. When multiple devices are selected, each device is placed on its own page so the exported report stays readable.

The single-device page also includes a direct report button. This is useful when an operator is already reviewing one device and wants to export the current device story immediately without returning to the report selection screen.

Each report includes the report creation time and the user who generated it. For command history, the report can also display who executed each command.

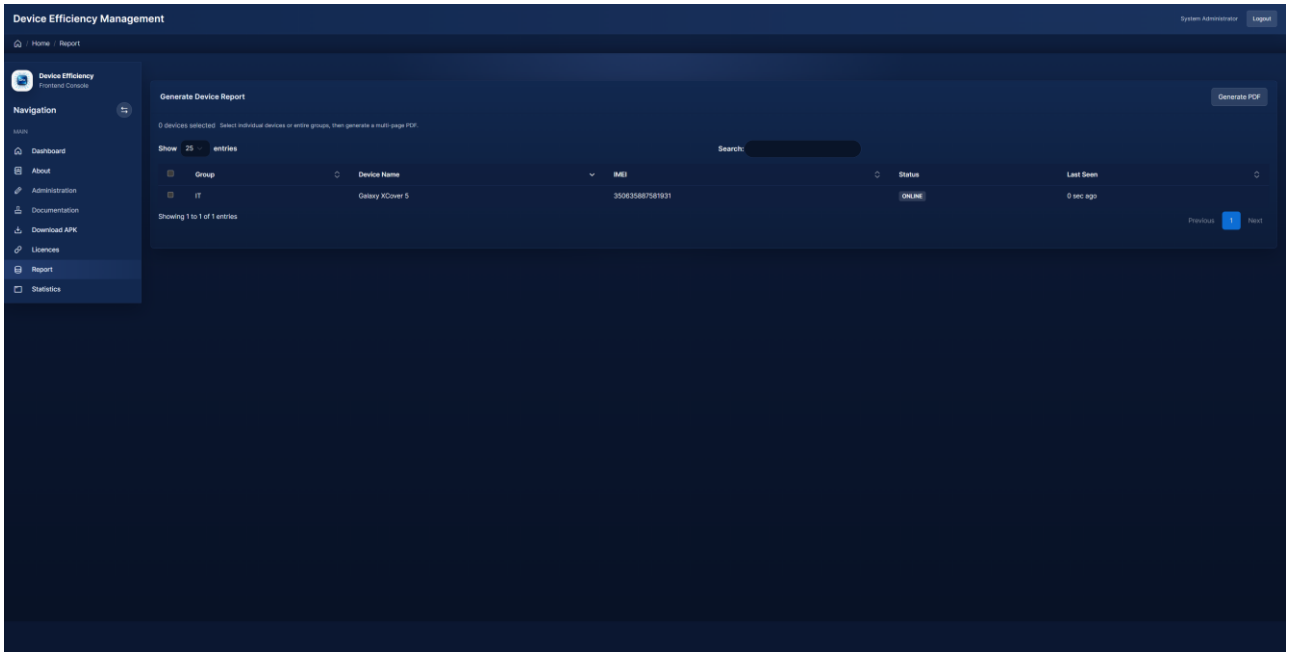

Figure 5. Reports page.

4. License Screen

The licence screen displays licence values associated with registered devices. It shows stored licence keys together with identifiers such as device ID, IMEI, device name, and MAC address where available.

This page is view-only and is available to both Admin and User roles. It is intended as a quick operational reference when checking which licence belongs to which registered device.

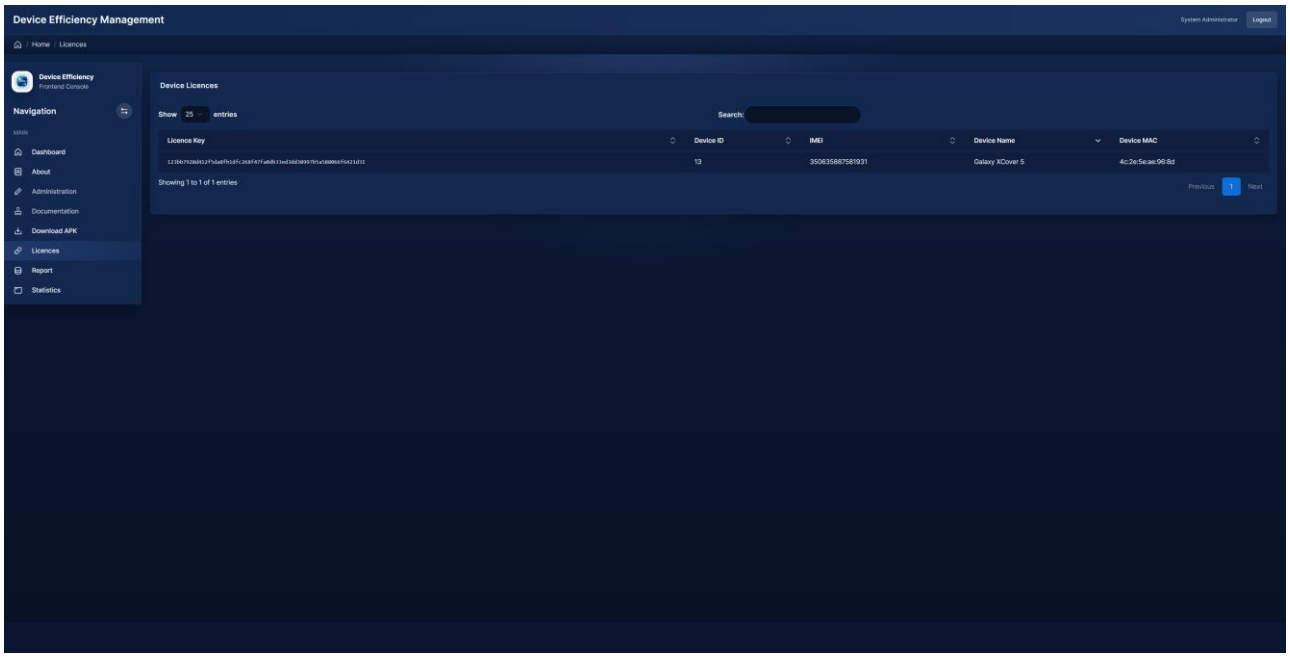

Figure 6. License page.

5. Statistics Overview

The dashboard also provides visual representations of device distribution and activity, allowing quick assessment of the current system state. Operators can use the main charts to understand how many devices are active in each group and how the fleet is distributed overall.

On the single-device page, the statistics view goes further by showing CPU frequency behavior, fixed sessions, application snapshots, crash history, and command history. Together, these views help users move from a broad fleet overview to a focused device investigation without leaving the application.

Because historical data is stored locally in the backend database, old information can still be reviewed after a device disconnects. This is especially useful when investigating crashes or looking back at frequency behavior after a session has ended.

6. Quick Reference

The table below summarizes the primary actions described in this guide.

User action	Result
Open dashboard	Displays the device overview with counts, charts, and the main device list.
Select device	Opens the detailed device monitoring view.
Generate report	Exports a PDF report for one or more selected devices.
Open licences	Displays the stored licence information for registered devices.
Download APK	Downloads the newest Android application package published by the backend.
Execute Fix / Reset	Changes device behavior through the command system. Available to Admin users only.
Request Stats	Triggers a fresh device statistics update. Available to Admin users only.
Open dashboard	Displays the device overview with counts, charts, and the main device list.
Select device	Opens the detailed device monitoring view.
Generate report	Exports a PDF report for one or more selected devices.
